Bullarook System

Water Balance Terms and Definitions

Water in Storage: The volume of water held in Newlyn Reservoir and Hepburns Lagoon

Forecast Inflows : The volume of forecast inflows in tributaries above the Bullarook storages that are yet to flow into storage. This estimate of inflows assumes there are no further rain events for the year. An assessment of forecast inflows is not required when all system commitments can be met by water held in storage.

Volume Below Minimum Operating Level: The volume of water that cannot be released through existing infrastructure under gravity at Newlyn Reservoir and Hepburns Lagoon.

Storage and River Losses: The volume of evaporation and other water losses from the storages and from the natural rivers, lakes and waterways that are part of the irrigation network. Also called headworks losses and include minimum environmental flows.

Urban and Environment: Entitlements held by urban water corporations and the environment.

Remaining Allocated Volume: The volume assigned to water share holders under a 100% allocation of high-reliability water shares and a 100% allocation of low-reliability water shares.
